

# Environment and cardiovascular disease in Switzerland

David Fäh  
ISPM Zürich

Universität Zürich  
Institut für Sozial- und Präventivmedizin

# Aims of this meeting

- Evaluate potential for collaboration between Swiss TPH and ISPM Zürich
- Contribution ISPM Zürich:
  - Concept
  - Experience
    - Swiss National Cohort and
    - Cardiovascular disease

# Aims of this meeting

- Contribution Swiss TPH:
  - Environmental data?
  - Knowhow in analyses?
    - Digital Terrain Model
  - Experience in air pollution?
  - Effect of ETS on heart- and respiratory function?
  - SAPALDIA?

# Research areas for collaboration

- Major priority: **physical** environment
  - Examine “independence” of altitude effect on CVD mortality
  - Evaluate involved factors
    1. climate
    2. air pollution

# Research areas for collaboration

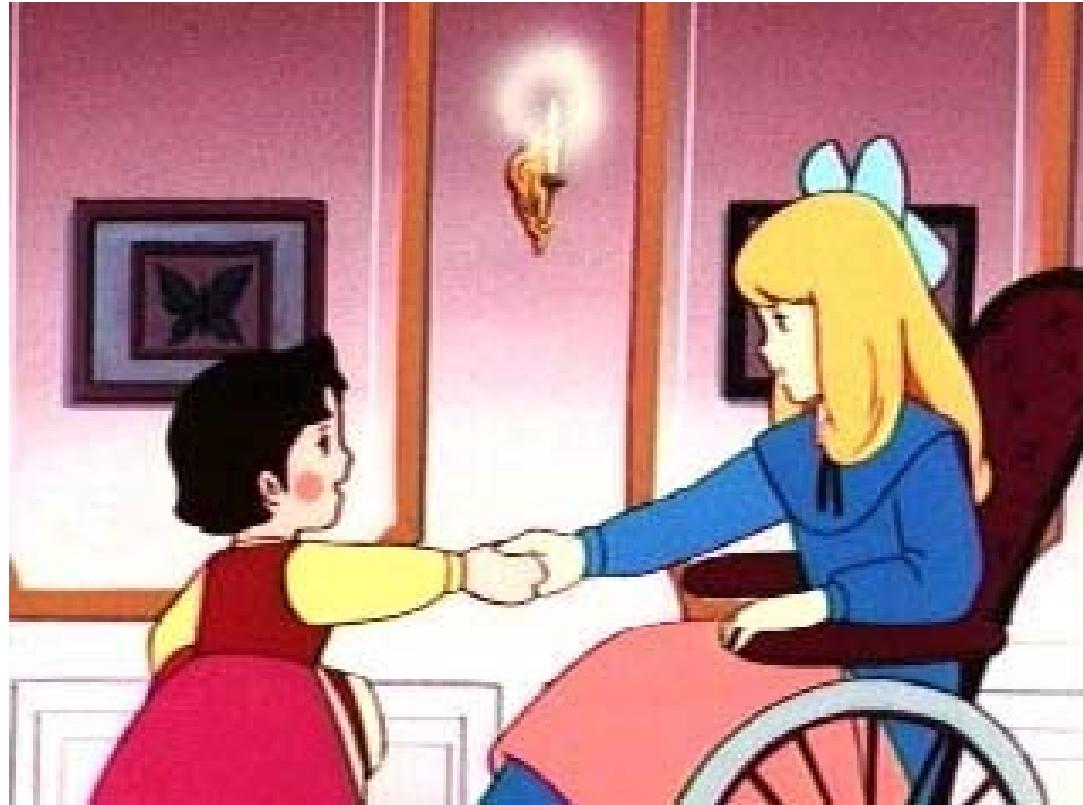

- Minor priority: **political** environment
  - Assess the impact of smoking ban legislation on CVD (and other disease) morbidity (and mortality)

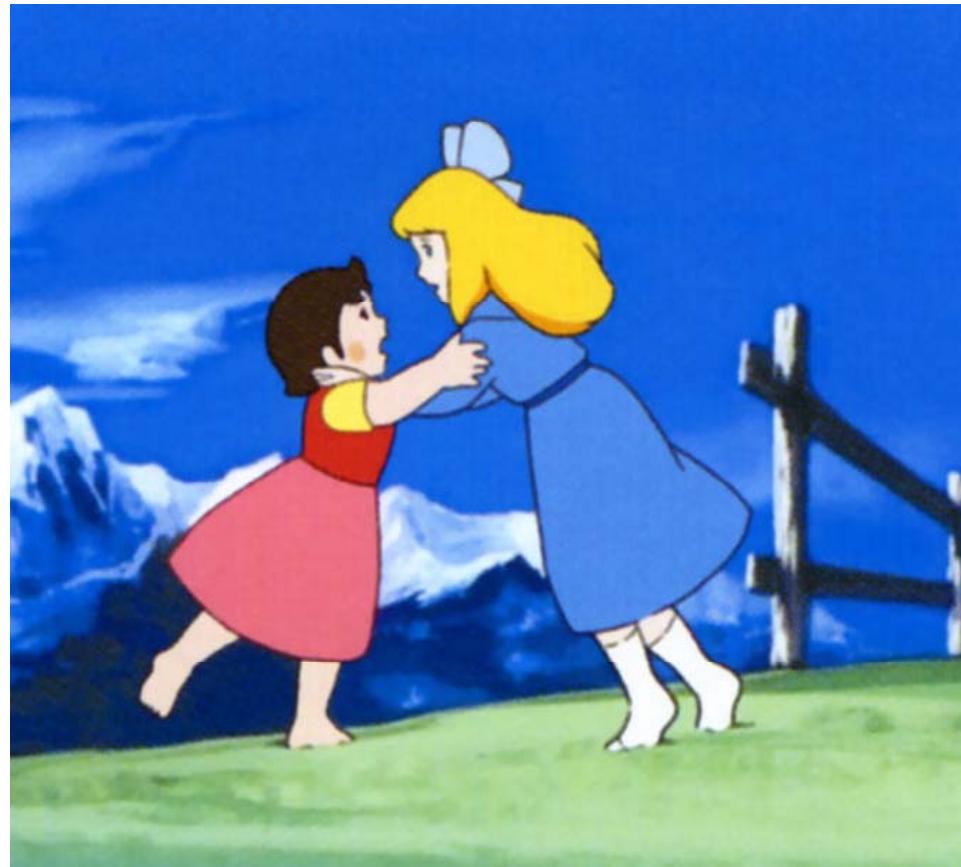

# Research area, major priority

Climate and other environmental  
factors associated with cardiovascular  
mortality in Switzerland

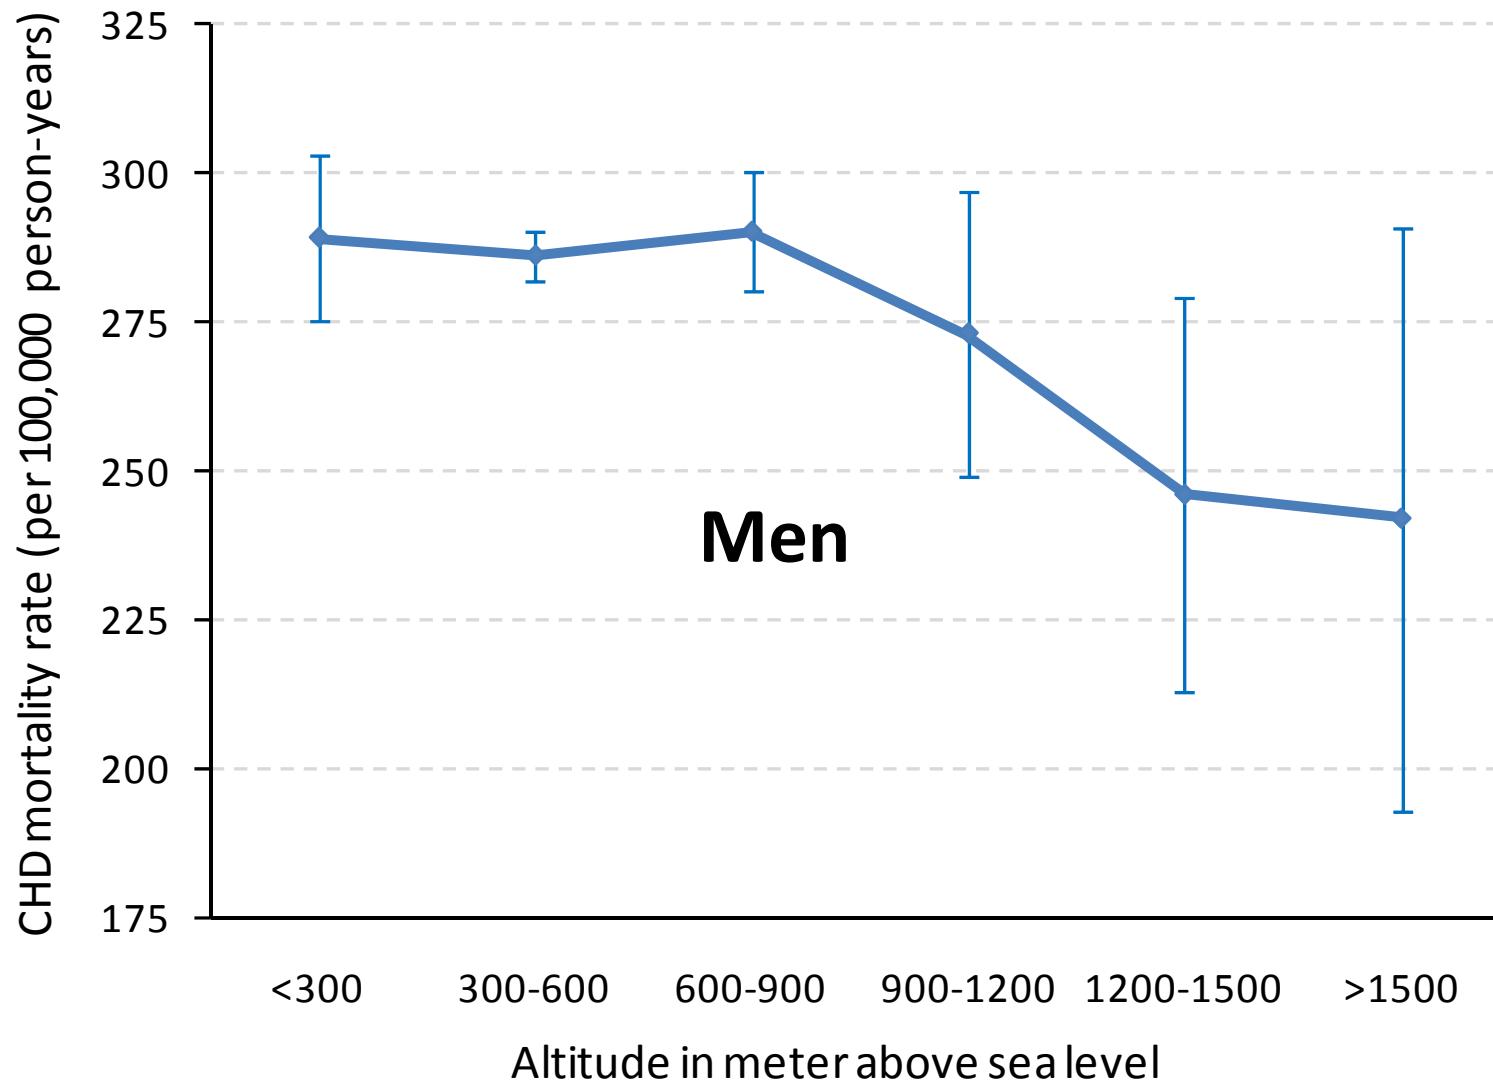

# Population

-  census & death registry
- 1.64 Mio ♀&♂ from German Switzerland
- Age: 40-84 years
- Altitude: 259-1960 m.ü.M.
- Place of residence and birth
- † coronary heart disease (CHD) and stroke

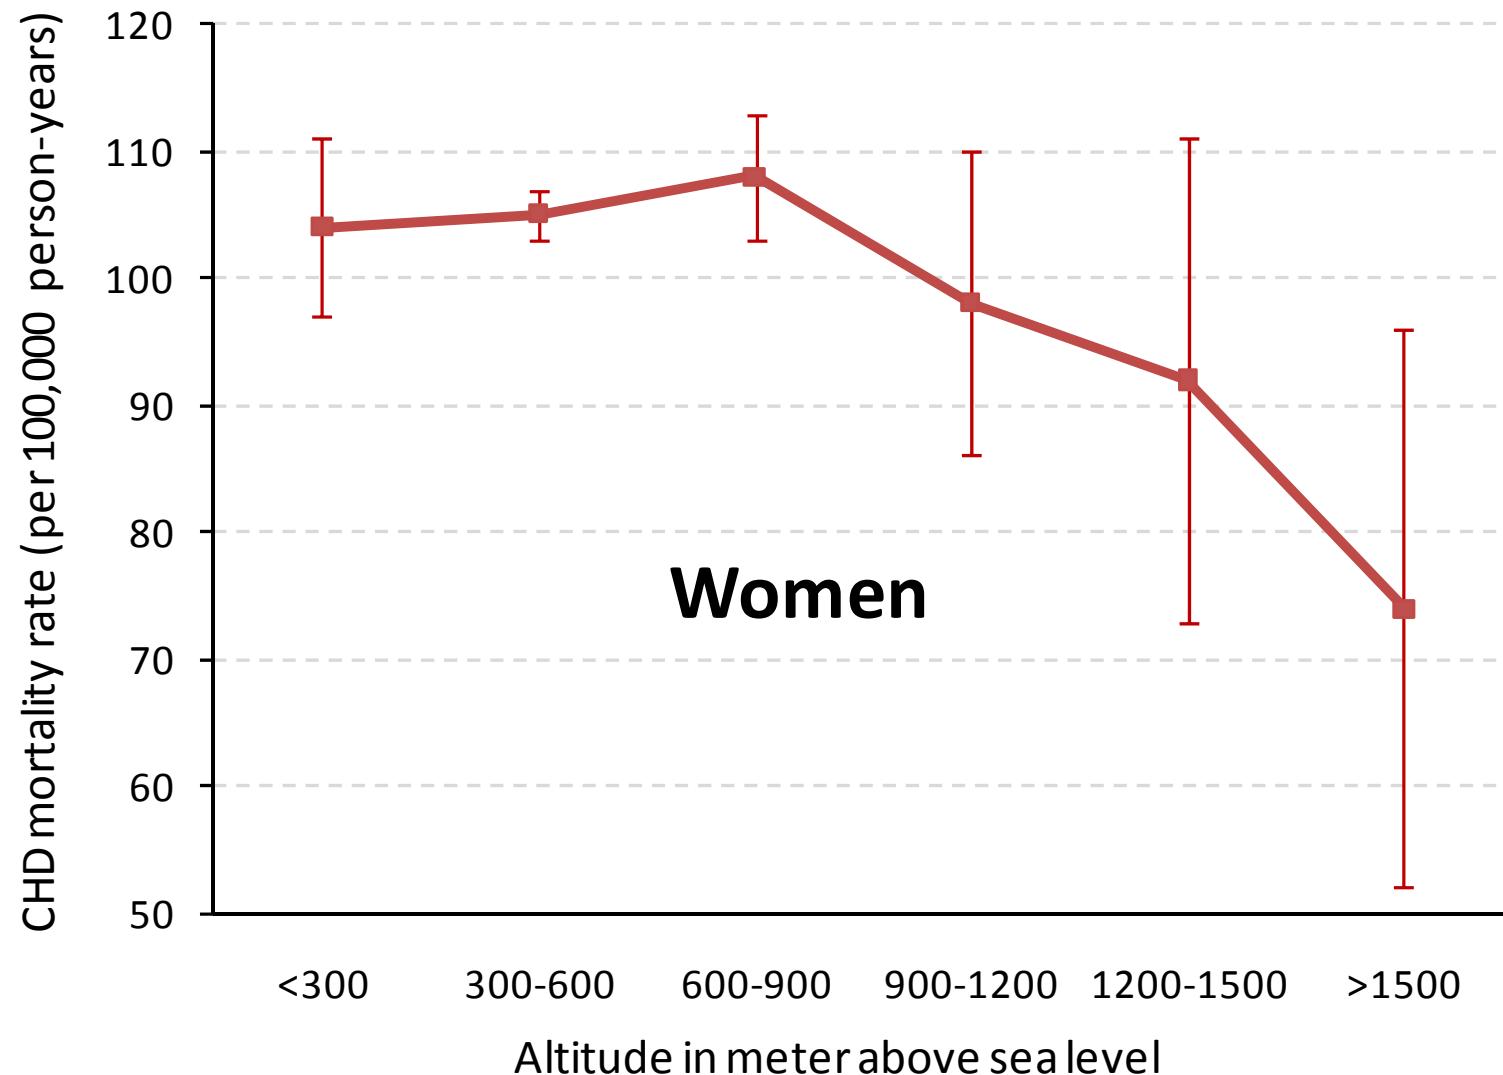

Circulation. 2009 Aug 11;120(6):495-501.

Research seminar Swiss TPH, 28.10.2010  
David Fäh: Environment and cardiovascular disease in Switzerland

Error bars are 95% confidence intervals

Universität Zürich  
Institut für Sozial- und Präventivmedizin

# Results of regression analysis

- Per 1000m of increase in altitude of place of residence
  - CHD mortality decreased by 22%
  - Stroke mortality decreased by 12%
  - Place of birth had an independent effect

Circulation. 2009 Aug 11;120(6):495-501.

Research seminar Swiss TPH, 28.10.2010

David Fäh: Environment and cardiovascular disease in Switzerland

Universität Zürich  
Institut für Sozial- und Präventivmedizin

# Possible mechanisms

1. Effect of altitude per se
2. Confounders
3. Effects associated with altitude

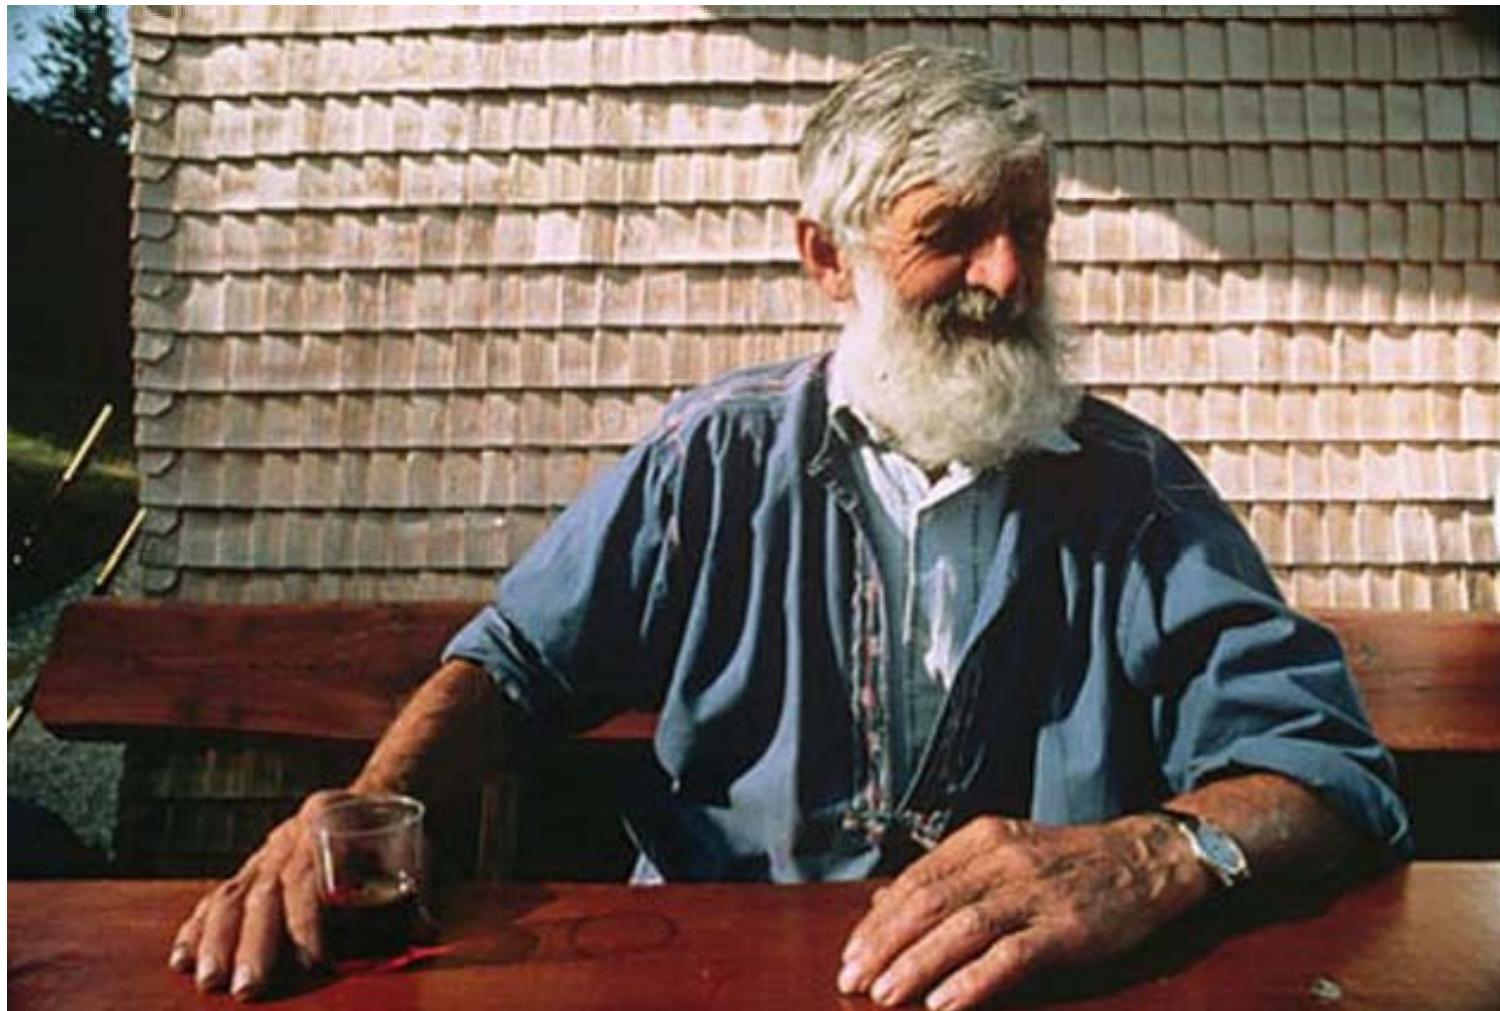

# 1. Effect of altitude per se

- Lower oxygen partial pressure
- Higher „return of investment“ from physical activity
- In utero cardiovascular adaptations?

# 2. Confounders

Research seminar Swiss TPH, 28.10.2010  
David Fäh: Environment and cardiovascular disease in Switzerland

Universität Zürich  
Institut für Sozial- und Präventivmedizin

Research seminar Swiss TPH, 28.10.2010  
David Fäh: Environment and cardiovascular disease in Switzerland

Universität Zürich  
Institut für Sozial- und Präventivmedizin

# 2. Confounders

- Probably no major differences between altitudes:
  - Obesity
  - Smoking
  - Physical activity
  - Diet
  - Alcohol consumption
  - Diabetes
  - Genetic background

### 3. Effects related with altitude

# Nebelhäufigkeit in der Schweiz im Winterhalbjahr in %

Beobachtung 100%: Fällt eine Nebellage auf, dann hat das Region Nebel

von allen  
Nebellagen

Auf der Basis von Wettersatellitendaten 1989-1991.

Institut für Sozial- und Präventivmedizin

# 3. Effects related with altitude

- Lower air humidity
  - Less fog
  - Longer sunshine duration (Vit D synthesis)
  - More bearable temperatures
- Thinner atmosphere
  - Higher Sunshine intensity (UV radiation)

Heart 2001;86:277-283 doi:10.1136/heart.86.3.277

# Other differences by altitude

- Urbanity (large cities at lower altitudes)
- Air pollution (including ozon)
- Access to health care services
- Natural Radioactivity (radon exposure)
- Drinking water
- Noise (traffic)?

# Aims

- Disentangle altitude from climate & other factors
- Consider the role of geographical aspect and slope (north vs. south of the alps)?
- Assess the influence of air pollution & noise
- Define “healthy environments” (ideal environmental conditions)

# Hypotheses

- Sustained and dose-dependent effect of sunshine exposure
- Sunshine has an effect independent of altitude
- Larger variations in mortality in winter- than in summertime

# Possible data sources

Data source	Information
Swiss National Cohort (SNC)	Socio-demographic parameters of individuals enumerated in census Geo-coordinates Subsequent death & cause of death
Swisstopo	Digital terrain model (DTM): geographical aspect, slope
Bundesamt für Meteorologie und Klimatologie (MeteoSchweiz)	Climate data (temperature, air humidity, sunshine exposure, precipitation)
Das Bundesamt für Umwelt (BAFU)	Air pollution and noise models
TeleAtlas	Distance to major roads

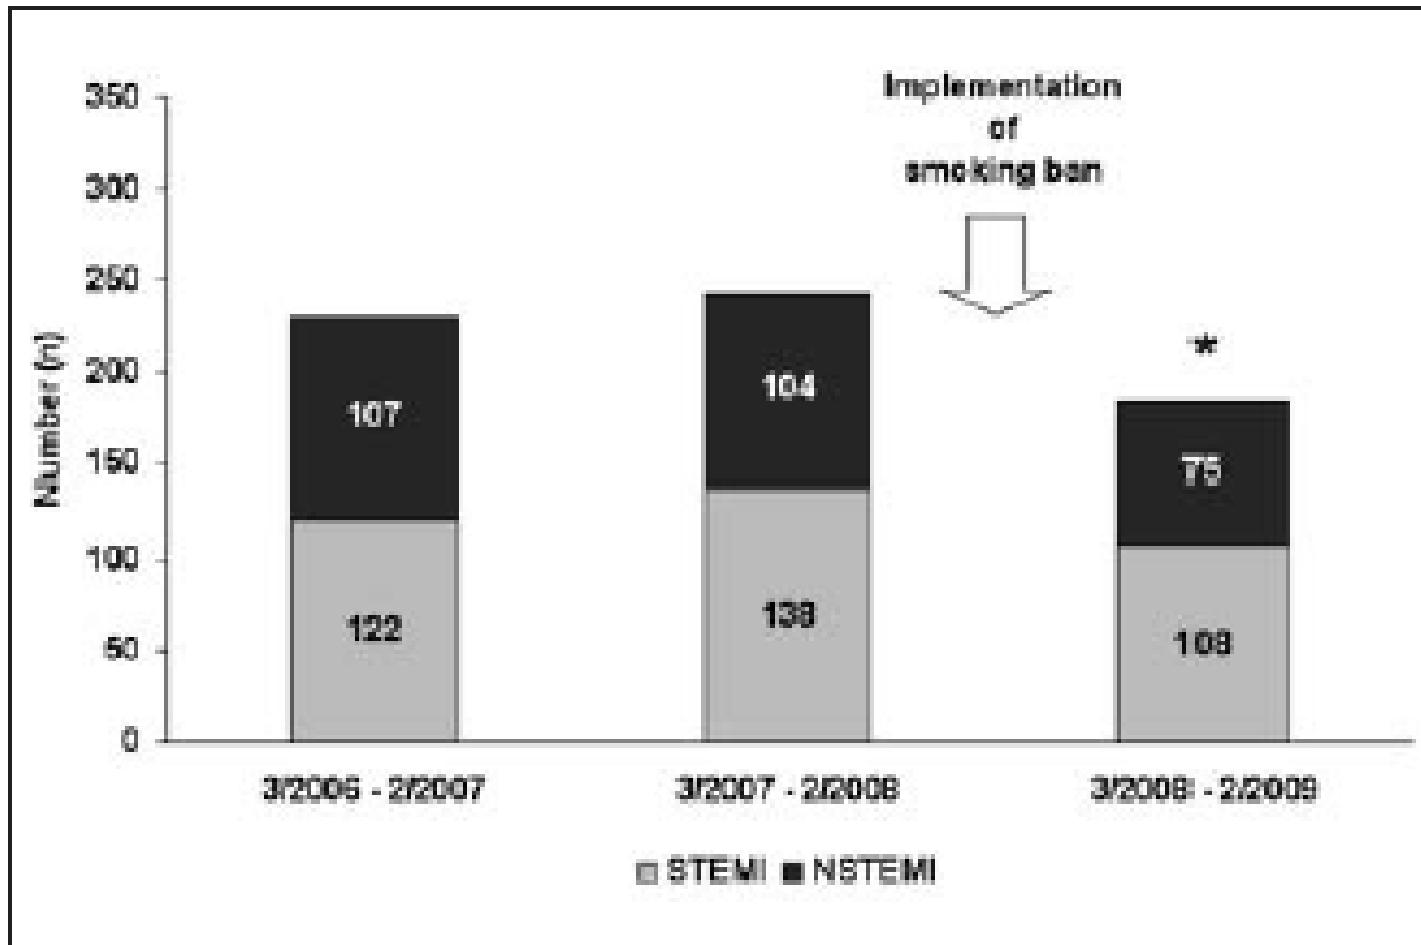

# Minor priority

## Public smoking ban and trends in smoking-related diseases

# What is known

- In various countries: public smoking ban related with decrease in incidence of coronary events
- Graubuenden (GR): public smoking ban associated with a subsequent decrease of AMI incidence

\* p <0.05 vs. each of the two previous 12-month periods.

# Research questions

- How sustained is the effect from GR?
- What about other cantons?
- What's the impact of smoking ban and of advertisement legislation on
  - selected CVD?
  - respiratory disease?
  - mortality and morbidity?
  - lung and heart function?

# Some hypotheses

- Decrease of incidence after smoking ban
  - regional variations according to strictness of
    - smoking ban implementation and
    - advertisement regulation
- Strongest reduction in
  - men
  - persons with low SEP
- Sustained effect

# Merci
